

## PARTICIPATE IN A RESEARCH STUDY AT YOUR OWN HOME!

Are you expecting a baby?

Do you have friends or family who are expecting a baby?

Researchers from the University of Michigan are studying infant eating behavior and interactions between mothers and babies the first year after your baby's birth.

For this study, we would meet you at your home when your baby is 2 weeks old. If you complete this visit, you will be eligible to participate in further follow-up visits. We will collect information about your baby by:

- Weighing and measuring you and your baby.
- Ask you to fill out some questionnaires about you and your baby
- Videotape and measure how much your baby feeds during a typical feeding and a slightly challenging feeding, using a device that attaches to the bottle
- Measure how much your baby feeds on your natural feeding pattern and how much your baby feeds on a slightly altered feeding schedule.
- Videotape and observe how your baby responds when he/she cannot eat right away (e.g. in the car, or if you're not around).
- Because we're now learning that stool may tell us a lot about health, we will ask for some samples of your and your baby's stool from the diaper.
- Ask you to provide a sample of your breastmilk
- If you and your baby are eligible, you will receive up to \$130.00 for participating. If you decide to continue to participate in the study, you could earn up to an additional \$715.00.

If you have additional questions or are interested in participating, please call us toll-free at **(877) 647-1121** or e-mail **abcbabystudy@umich.edu**.

Thanks! We hope to hear from you! ☺
